

Why Is Everyone So Depressed? The SSRI/School Shooting Connection

In my last post, I attempted to shed some light on the obvious association between SSRI medications (antidepressant drugs, like Prozac) and the recent wave of wholesale shootings/suicides. The correlation is so profound that

it should at least warrant some serious investigation, yet all is quiet on that front as the politicians instead rush to blame a very old technology for a very new problem. This is a sickening exploitation of the death of children, simply to prop-up bad legislation that offers no real solutions to the problem, but instead rekindles long-standing , irrelevant battles between Special Interest Lobbies and Congress.

More than 1 in 10 Americans take at least one of these SSRI drugs regularly. Why suddenly, does everyone need to be on antidepressants, when humans have thrived for tens of thousands of years without them? Are people actually becoming more and more depressed and mentally ill? If so, then why? These are the questions that I would like to take a look at in this article

I certainly do not believe that everyone prescribed these drugs are clinically depressed nor in need of any chemical sedation. As I mentioned in the last post, my wife and I were both offered these drugs by doctors, even when we were not expressing any feelings of depression. These new wonder pills are just another fad drug (similar to Valium in the 1970s), which are being prescribed for anyone with a complaint, but no

real disease. Even though I believe they are given out to perfectly healthy people, I do believe that depression has been on the rise in the last few decades, but handing out SSRI medication certainly does not answer the question as to why.

It appears to be the goal of modern medicine to treat a symptom, rather than the cause of a disease, perhaps because it is far more profitable to establish life-long treatments than simply finding a prevention or cure for a disease. I believe that there is a root cause for the massive amount of clinical depression arising in the western world and it is not simply because of a poor economy, terrorists and every other excuse being tossed around. Humans have had to deal with everyday stress of survival for millions of years and very few americans are actually affected by terrorists – only through the scare tactics shoveled out by the media.

The rise in the rate of depression seems perfectly in sync with the evolution of the American diet. Depression has been on a steady incline since the 1970s ([depression in woman has doubled since 1970](#)), which was also when the hysteria concerning high cholesterol began to take hold of America. Each decade following has pushed the desired cholesterol levels lower and lower and lower. The most recent advertisements for Crestor now claim that your doctor's goal for your cholesterol is below 100 mg/dl – that's suicide – literally!

Low cholesterol, depression and attempted suicide appear to go hand in hand in every clinical study. The association is undeniable. This article from [Psychology Today](#) ([full article](#)) plainly states:

As low cholesterol is linked to depression, low cholesterol is also a risk factor in suicide attempts."

Of course, like any modern medical publication, they paint a

dichotomy by echoing the rhetoric about high cholesterol causing heart disease, even in spite of a 2009 study published in the American Heart Journal that showed that [75% of heart attack victims admitted to emergency rooms tested with low to normal cholesterol levels](#). Read what Dr. Dwight Lundell, a heart surgeon who has performed more than 5,000 open heart surgeries, has to say concerning the role of cholesterol in heart disease [here](#). Why would nature evolve us to be “damned if we do, damned if we don’t” – it wouldn’t. So, one of these theories has to be wrong and I believe that the evidence for cholesterol causing heart disease is far weaker than the link between low cholesterol and depression.

This all tends to make sense once you realize that the [brain accounts for 25% of the body’s total cholesterol](#). Your brain and nervous system are made predominantly of this molecule. Then again, we have the fact that most of our [hormones are also constructed from cholesterol](#) and it becomes obvious how low cholesterol can cause mood problems. Little wonder why [vegans tend to be extremely moody and temperamental](#)?

The human body is completely incapable of making many of the essential hormones without cholesterol, including the male hormone testosterone – perhaps explaining the need for Viagra and Cialis in our zero cholesterol society? Studies have proven that low testosterone not only [causes a lower libido](#), but can also [cause severe mood swings](#). Many children today are placed on low-fat diets from birth. Human breast milk is very high in cholesterol by nature, much higher than cow’s milk; I guess this was just another mistake that evolution made.

Now, babies are fed very low-fat formulas at the point in life that the brain begins developing – remember, the brain is made predominantly from cholesterol, which might explain why human milk is so high in it. Cholesterol is so important to our health, that not only is it manufactured in the liver, but every cell in the human body can synthesize cholesterol if

necessary. This is why the pharmaceutical companies had to create certain drugs in order to pound cholesterol down to the unnaturally low levels they recommend. Very few people realize that the [American Heart Association even scoffed at Ancel Key's "Lipid Hypothesis" up until the year that he was appointed to their board of directors.](#) [Click here for a great breakdown on the history of how the bogus Lipid Hypothesis came into being.](#)

Once the AHA foolishly adopted Keys erroneous theory, the drug companies ran to manufacture drugs that could lower cholesterol. This would ultimately become the 30 billion dollar a year industry that is presently their leading cash cow. Cholesterol lowering drugs are the top money-maker for the pharmaceutical industries, is it any wonder why they are the driving force behind perpetuating the lie that is the "Lipid Hypothesis" and bury any evidence to the contrary?

Most of everything that your doctor believes, was taught to them by the pharmaceutical companies and their less-than-honest studies. Here are just a few pieces of evidence of the drug companies influence over medical schools [here](#), [here](#) and [here](#). Even many years after leaving medical school, nearly every [lecture, conference or piece of literature](#) that your doctor is provided is paid for by the pharmaceutical companies – they are the core of modern medicine and doctors are strictly the licensed vehicle they need to distribute their wares.

Now we see that SSRI medications are beginning to close in on the profits of statins by garnering some 19 billion dollars in revenues. The pharmaceutical companies are double-dipping on this one. As long as they continue to perpetuate the myth that cholesterol causes heart disease, people will lower their cholesterol, thereby becoming depressed – not to worry, they have the answer for this with another magic pill – a pill that also causes thoughts of suicide! How long until they invent a pill that will attempt to prevent the suicidal side-effects of

the SSRI? That's how the pharmaceutical game works. Let's take a look at just how SSRI work to prevent depression – at least in theory.

SSRI stands for "[Selective Serotonin Re-uptake Inhibitor](#)", which means that the drug increases the amount of [serotonin](#) available at the synapses of the nervous system by inhibiting the body's ability to re-uptake the excess serotonin. These nerves also include the brain. The synapse is a fancy name for the gap between nerve endings. As a signal is sent along a nerve, it ultimately reaches a nerve ending, where the signal must be relayed across this gap or "synapse". This relay is achieved by the secretion of certain chemicals, like [acetylcholine](#), serotonin and [glutamate](#) called neurotransmitters.

Any one of these neurotransmitters in extreme abundance can be considered an [excitotoxin](#), because they will keep the nerves constantly firing, which we are not designed to do. This action can

eventually cause cell damage to the nerve. Do any of those chemical neurotransmitters sound remotely familiar with any ingredients in the American diet? How about glutamate – as in Monosodium Glutamate (MSG) – does this ring a bell? MSG became a necessary ingredient in most processed foods the minute that the fat was removed. Food without fat can become rather flavorless and boring to eat. Flavor enhancers, such as sugar, salt, MSG and aspartame made up for the loss of fat and excited the nerve endings, which creates a pleasurable experience in the brain when eating this non-nutritious garbage.

Glutamate is used in literally thousands of food products from frozen pizzas to chips and cookies. It is hard to know all the products that contain MSG, because the federal government

allows manufacturers to list it as “natural flavorings” in their ingredients list – but Americans are consuming a butt-load of this chemical. So, is the real problem with the rise in depression caused by a lack of serotonin or is it too much glutamate? High glutamate levels have also been associated with [OCD](#) and other brain disorders [in some studies](#). Glutamate is also manufactured in our bodies from blood glucose, so it has been found to be very high in those with type 1 diabetes, also causing depression ([source](#)).

Whenever any of these neurotransmitters become out of balance, depression is sure to follow. It is very apparent after a little study that the modern problem of depression is rarely that serotonin levels are too low, but that glutamate levels are far too high and that is easily associated with the modern diet of processed foods, which jack-up blood glucose levels and dump tons of excitotoxins, such as glutamate and aspartame, into our children’s bloodstream. The following is a must-see report on flavor enhancers aired 60 Minutes. They are quite candid on what the manufacturers are trying to achieve when designing these chemical cocktails.

They admit that their goal is to create an addiction and design flavors to not “linger”, so you will want to eat more and more, never being satisfied – how ethical is this practice in a nation suffering from a rising obesity problem? By every definition, these flavor enhancers behave more like a drug and just like street drugs, they continue to get more powerful as the technology progresses.

The medical industry’s solution is very similar to their solution to the imbalance of fatty acids, also caused by the modern diet. The medical community would have us believe that humans do not get enough omega 3 fatty acids, DHA and EPA, in their diet and therefore why they constantly push fish and flaxseed oil to patients. But, the reality is that americans consume far too much omega 6 fatty acid via

vegetable oils (actually seed oils, because they came from grains or beans).

This again is a mainstay of processed foods and is also recommended as being more heart healthy than saturated fat. Rather than have people cut down on the amount of plant derived oils, the insanity is now to attempt to match the over-consumption and resulting inflammation of omega 6 fatty acids with an over-consumption of omega 3 fatty acids.

In a similar way, these same geniuses are attempting to offset the high glutamate levels, caused by a diet high in processed foods, by jacking up the serotonin levels at the synapse of the nerves. This is a complete over excitement of the nerve cells and is little wonder why this experiment is beginning to back-fire. Their logic reminds me of the children's song, where the old woman accidentally ate a fly and then she decided to eat a spider to catch the fly. She continues to eat larger and larger animals to get rid of the last one, until ultimately eating a horse, which finally kills her ([lyrics here](#))).

I don't think you can cheat nature this way – excess is excess, but no entity of commerce would dare advise anyone to reduce the consumption of any product, when they can double their profits by advising you to double your consumption of something else. It's like telling you to eat a pound of poison and not worry, because I have a pound of antidote. Who would do this? The old woman in the story would be proud of this logic, unfortunately she's too dead to enjoy it.

I am sure that the people who have very low cholesterol and are inundating their bodies with all these excitotoxins do feel better when first taking these drugs, but we can see that it leads to a much larger meltdown as time passes. It also appears that the problem becomes even worse when someone on these SSRI medications withdraws from them. These drugs are extremely addictive and create a dependence by taking away the

body's natural ability to "feel happy" or "good" without the drug.

Not unlike [methamphetamines](#), this dependence seems to become permanent or at least have withdrawal symptoms so long that few people make it without going back to the drug or committing suicide. It would seem that the dopamine receptors are severely crippled after long-term damage to the nerve cells, so with or without the drug, the patient experiences a hopelessness and inability to feel good about life anymore.

With methamphetamines, the dosages must be continually increased in order to achieve the happy feeling the user desires – ultimately the drug no longer delivers the happy feeling at all, but the drug must be continued just to prevent falling into a feeling of total desolation. Without the drug, their life becomes a dark and miserable place. I think we are seeing evidence that these SSRIs can produce a similar result and a similar feeling of despair in some users when the drug is no longer taken.

Some of these maniac shooters had stopped taking their medication prior to their explosion. This leads many to believe that these people were insane to begin with and that the SSRI medication made them civil. Once they stopped taking the medication, they went back to being nuts. This could be a possibility, but that theory begins to fall apart when we see how many of the shooters were still on their medication when they went postal and the fact that very few of them had shown any signs of violent behavior towards others prior to being on the drugs. ([Here is a list of shooters and the drugs they were on or withdrawing from at the time of the shootings](#))

We will never know the answer, because no one cares to investigate this problem. The politicians, news media and Hollywood know-it-alls see these shootings as an opportunity to further other political agendas they hold dear – they also

hold the megaphone with which to shout their opinions much louder than the rest of us and draw all attention away from this problem.

Though I believe that many doctors prescribe these drugs to people who are not depressed or are just going through a temporary depression with an obvious cause (death in the family, divorce, loss of job, etc..), but there is a growing population of people who are manic-depressive, and that number is most likely growing because of the deterioration of the American diet. As the medical professionals continue to push the recommended cholesterol level lower and lower and the manufacturers of these flavor enhancers continue to make them more powerful, this problem will become worse.

Each generation of children are raised on more highly processed diet than the previous one – food lower in fat and higher in exitotoxins. Younger and younger children are being placed on these drugs as a result. Our government has pretty much taken over the diet of the American children through the school system. There are some states who have begun to make the [school lunch program mandatory](#), not allowing parents to send their children to school with a homemade lunch.

I have read other stories of some schools that inspect the lunches sent from home and have [confiscated any foods that their diet guidelines doesn't agree with](#) (the confiscation was claimed to be a misunderstanding, but this is the type of problems that will arise once the genie is let out of that bottle).

This next video is a good illustration of just how fake our modern food can be. Remember as you watch this, according to the story of the confiscated lunch in North Carolina, the chicken nuggets were the school system's replacement for the turkey sandwich. Let's see what our government considers a

superior food.

I am not sure how American parents are going to take back control of the food that their children eat, but if something is not done soon, this problem will continue to grow, no matter how many weapons that the government decides to ban. The school lunch mandate also included fruit juice, which may as well be soda as far as quantity of sugar and artificial flavoring. If a parent does not want their child drinking this liquid candy, what right does a school have provide it to the child?

In Summary

It seems quite clear that the problem begins with this American diet that is low in healthy fat and cholesterol, yet high in sugar, starch and flavor enhancers (excitotoxins).

Low cholesterol and high glutamate levels is a recipe for depression, OCD, and ADHD. This leads to a visit to the doctor, who will no doubt prescribe one of these drugs, further elevating the level of excitotoxins at the nerve synapse, which will ultimately cause cell damage to the nerve endings and dependence on stronger and stronger doses. Given the fact that these drugs are being administered to people at a younger and younger age, even at the point where a child's brain is still growing and developing, how are we surprised when these kids go off the deep end? And why is it that our leaders in both politics and medicine cannot see this pattern and refuse to investigate?

I think this is the appropriate time to say, "follow the money". The pharmaceutical companies have an endless goldmine propping up the lie that cholesterol is deadly and setting the desired level far too low to achieve by diet, thereby needing their cholesterol lowering drugs to smash cholesterol down to a level that nature never intended (remember, their statin drugs work by crippling the liver's

ability to manufacture cholesterol – like everyone's liver decided to take out a contract on our hearts). This accounts for 30 billion dollars per year for statin drugs. Perpetuating this lie for profit has also caused the American people to reduce their fat intake, even to their children, whose developing brains need cholesterol far more than an adult.

This all leads to depression, onset by the lack of cholesterol, coupled with the high intake of excitotoxins. The fact that children consume more junk food than adults, further complicates the problem as junk foods are inundated with these flavor enhancers. Now we finish off the poor child's brain by tossing in more excitotoxins in the form of drugs in an attempt to offset the ones in the highly processed foods. Using flavor enhancers is far cheaper to produce processed food and the removal of fats also extends their shelf life, so it is far more profitable to the food manufacturers to continue this pattern.

Then we have the fact that the politicians not only receive huge contributions from both of these entities (pharmaceutical companies and processed food manufacturers), but they also have other agendas that expand federal government power by taking away the liberty of the people to make their own choices. It was not only the talk of gun bans (the dream of every politician), but there was also a lot of rhetoric concerning the expansion of mental health – translation: MORE POWERFUL DRUGS and easier access to them.

Given the fact that Obama's goal is "Mandate people to behave" (according to his interpretation of behavior), may we also see court ordered medications for those deemed mentally ill in our near future? Possibly even those deemed physically ill? A heart attack victim may be ordered by the court to take statin drugs once Obamacare becomes the law of the land.

Why people continue to place the welfare of their children

into the hands of a government that has lied to its people so many times and been flat-out wrong in many of its assumptions, boggles the mind. It is actually not so hard to understand once you see the fear that is created and maintained by our leaders and the media by the corporations and special interest groups that support them both.

I plan to cover this in greater detail in an upcoming post in my newest category called "Fear Mongering". Creating fear is the favorite tool of commerce and it is through that fear that we surrender our right to make choices for ourselves and do what we're told by the media and their sponsors. Americans must find the courage to take charge of their own lives and decisions, before we completely lose the ability or freedom to make those choices.

The Unasked Questions About School Shootings (Sandy Hook)

I have been working on several articles, two of which I hoped to release in the next week. Unfortunately, I have put them on hold for a couple of days in order to write this very controversial post concerning the debates that will no doubt rage throughout the holiday season, because of the horrific shootings that happened in Newtown, Connecticut last week.

These kinds of crimes simply boggle the mind and leave everyone with their jaws agape, trying to make some sort of sense out of such an event. So, everyone does exactly what they always do in these situations, which is why they continue

to happen. The media rushes in and plasters the identity of the shooter across the global satellites, when this type of infamy was likely his motive and sends a clear advertisement to the next wacko who is seeking attention, that he too will be martyred (which is why I refuse to mention his name in this article).

And though the media will make this killer as notorious as he wished to be, there is no need for a criminal investigation, because the politicians have already convicted the firearm as the responsible party, the shooter was just another victim of the easy access to guns. Blaming the gun, or more accurately, the freedom to attain guns as the reason for these crimes is not only misplaced justice, but is not even asking the right question. The question should be; what would make someone want to shoot and kill defenseless children, irregardless of the weapon they use? Is it strictly access to firearms that is the root cause of all of these school shootings?

Americans have had access to guns ever since the American Revolution and there are far more gun restrictions now than there ever was in U.S. History, and Connecticut has some of the strictest. Why have we never seen these type of senseless shooting spree (without motive) prior to the last 20 years? [Billy The Kid](#), [Jesse James](#) and [John Wesley Hardin](#) did not shoot as many people in their entire criminal career as this nut-job killed in one day. One argument says that it is because people now have access to more powerful weapons which can fire large capacity magazines. Is this truly the cause?

In the 1920s, just about anyone could walk into a Hardware Store and purchase a [Thompson submachine gun](#) (which could hold 100 rounds of .45 ACP ammunition in its drum magazine and was FULLY automatic). "Tommy Guns" were used in the "[Saint Valentines Day Massacre](#)", where it is said that some of the victims were nearly cut in half by the enormous spray of bullets. Bonnie and Clyde preferred to use the BAR ([Browning](#)

[Automatic Rifle](#)), which had the capability of shredding through the heavy iron in cars of that period with its .30-06 rounds. So the idea that today's weapons are more powerful and capable of a higher rate of fire is a completely erroneous one.

But even though there were bloody shootings in those times, all of the crimes committed had very clear motives. They were either based on greed (robbing banks or trains) or fights over gangland territory – never just for the execution of unarmed children, followed by the suicide of the shooter. If automatic guns were truly the source of the problem, then we would have expected to see similar school shootings/suicide from the periods of 1890s to the 1930s. Most of the violent crime from 1920 till 1933 was the result of the prohibition on alcohol. This prohibition actually increased crime in the 1920s in the same way that the “War On Drugs” not only helped to create an underworld, but has increased the size and power of such organized crime and placed more drugs on the street as a result – but I’m sure that the prohibition of guns will not have that same effect.

The school shooting/suicide that we see today are unlike any crime we have seen in the past. These shootings are completely senseless – the work of an animalistic and suicidal mind. So the other proposal that has been talked about all week has been government offering better care for the mentally ill. Yet again, we have always had mentally ill people here in the U.S., yet we have never seen these type of wholesale murders, with no apparent motive, happen with such frequency.

Why does this new brand of mental illness seem even crazier than before? We should be looking for something new – something that did not exist more than 30 years ago. There is one difference that has yet to be discussed by any politician or anyone in media – and for good reason.

Though the politicians and media will bring the gun control debate straight to the headlines, it will be many months from now, when the people have lost interest in the story, that the real truth will slip its way onto page 14

of a paper or news website. This is what has happened in every other shooting. In [over 90% of these completely senseless shootings](#), it is later found that the perpetrators were not only mentally unstable, but had been on antidepressants, mainly [SSRI medications](#), for many years prior to going totally apeshit.

Please click on this [link](#) to see a list of school shooters and what antidepressants they were taking. That's a pretty comprehensive list – and much longer than expected, wasn't it (around 4,800)? All SSRI medications list the possibility of suicidal tendencies as a side effect and research has shown that these suicidal effects are much more pronounced in the [younger patients that take them](#). Seniors have the least negative effects, but the younger the patient, the stronger the thoughts of suicide tend to be. Some of these shooters had stopped taking their SSRI, which are highly addictive drugs and can cause greater difficulties when sudden cessation of the drug is attempted. A person on these drugs must be removed from them gradually or really bad things can result.

Absence of these mind-altering drugs seems to be the only marked difference between killers of the past and these modern school shooter/suicide killers, whose actions of violence are totally mindless and suicidal. When these kids start mixing these pharmaceutical monsters with alcohol or illegal street drugs, like [methamphetamine](#) or [Bath Salts](#), you have a real recipe for death and mayhem. The fact that this most recent shooting incident has created a knee-jerk [outcry for better](#)

[mental health care](#), means that the pharmaceutical companies will have more funding with which to create even more potent antidepressant drugs.

The correlation between these drugs and the total mental meltdowns we see are so strong that it begs the question, why is no one in the media, or the crying President, talking about this possible connection? Pharmaceutical conglomerates are major sponsors of the news media. Have you ever noticed the thousands of pharmaceutical advertisements inundating the local and national news media? Since when does anyone in the media speak ill about the practices of the pharmaceutical companies or the ease with which doctors prescribe these medications to children?

Because doctors have been elevated to a god-like status in our country, these drugs are always considered the solution to the problem, so people are incapable of considering them as a contributing factor ([cognitive dissonance](#)). The national media will always toss guns into the center of the debate while everyone's emotions are running high, thereby putting up a smokescreen to where the real truth lies – because guns frighten people and prescription drugs don't – even though you have a 6,200% better chance of being killed by a doctor than you do a gun. 290 people are killed each day in the U.S. by prescription drugs, and that only includes direct deaths from the drugs, not the deaths of those who may be killed by the one under their influence (shooter, driver, etc.). In order for gun deaths to eclipse the deaths from pharmaceuticals, there would have to be an Aurora, Colorado, Batman movie massacre take place every hour of every day, 365 days a year.

The pharmaceutical companies contribute millions of dollars to elected officials and until one of their concoctions kills thousands of people in a way that can no longer be hidden, then, and only then, will the FDA reluctantly pull one of their poisons from the shelves. The drug [Vioxx](#) killed nearly 60,000 people before the FDA finally took action. It is in

the best interest of the pharmaceutical giants to protect the doctors, because it is only through the doctor's license that their chemicals are distributed. Just between the years 1996 to 1997 the amount of children on antidepressants rose from 8,000 to over 40,000 and nowadays number continues to rise.

There has [no long-term study](#) on the effects of these drugs on the developing brain of a child (mostly adult studies). These SSRIs are being handed out like candy on Halloween and not just by psychologists, but even General Practitioners have gotten into the act. These drugs are not only easy to get, but doctors seem to insist on everyone taking them. Here are just some of my experiences:

All of the intestinal transplant recipients were automatically placed on antidepressants (Prozac), because the doctors claim that 100% of them go into depression (I found that most people will take whatever a doctor gives them, so all of the other patients I know still take the antidepressants). When I refused them, a nurse told my wife that I was showing "classic signs of depression" (why does a nurse feel she can diagnose that?). Next, they secretly sent in a psychologist to examine me. The shrink found that I was not depressed and they finally got off of my back. I told them that I knew I wasn't depressed, because if anything, I have high anxiety (probably from being cooped up in a hospital for more than a year) and they told me that the SSRIs would help with the anxiety also and still attempted to give them to me.

What? It seems like anxiety and depression are like polar opposites, yet, somehow this magical elixir can cure both.

Years before I met my wife, she told me she had went to a doctor simply to get a blood work-up. The doctor ran the blood test and told her she was healthy, but then suggested that he write her a prescription for SSIRs. When she refused, he began to ask her personal questions – just digging for a reason to give her the antidepressants. She became offended by his questioning and never went back to that doctor.

I still suffer some chronic abdominal pain (most likely caused by surgical adhesions). When I described the pain to my primary physician, she wrote me a prescription for Prozac. I figured she was insinuating that the pain was all in my head, but she claimed that antidepressants also have pain relieving properties (what can't they do?). Of course, I refused the medication. She then offered to write my wife a prescription for SSRIs, just because she was in the office with me – I am not kidding. She thought that my wife could use them because of all the stress she went through while I was in the hospital, yet my wife never asked for them, nor did she accept the offer. This is how easy it is to get these drugs.

Doctors seem to automatically place everyone on them for any reason. It would certainly appear that there is some sort of incentive for doctors to write scripts for these pharmaceuticals.

Any child diagnosed with ADHD will ultimately end up on these SSRIs. Children, especially teenagers, can go through a lot of mood changes – it's called adolescence. No one gave us drugs for that when I was young. As a matter of fact, one of the best drummers I was in a band with was a guy who was very hyperactive as a child. He had trouble paying attention in school, because of the ridiculous amount of energy he had.

In today's time they would say he had ADHD and placed him on drugs. Back in the 1970s, the doctor told his mother to get him into sports or buy him a drum set, so they bought the drums. He had been beating on those things since he was eight years old and damn, did he get good – and had endless stamina.

That's how they dealt with children back then, they tried to turn a negative to a positive – now we give them drugs and turn them into killers.

I have been doing a lot of research on this subject, even prior to the recent shooting. I have a grand-nephew who has been diagnosed with ADHD and is always getting sent home from school. I have a suspicion that his behavioral problems could

stem from a wheat allergy, which seems to run in my family. I have seen him at family functions perfectly behaved until about twenty minutes after stuffing his face with tons of bread, cakes, pies or cookies. At that point he becomes a terror – totally out of control and unable to listen to authority – like someone on drugs. I know that all children love cookies and cakes, because I have 2 nephews, 6 nieces, 3 grand nephews and 2 grand nieces, but his craving for wheat is unlike anything I have seen in any of the other children. It is not just for sweets, he can't get enough bread, and if he is not watched, he will eat an entire meal in bread.

Some studies have shown that a wheat protein called gliadin can cross the blood-brain-barrier and bind to opiate receptors in the brain (please read [here](#) for much more detail from Dr. William Davis on gliadin). This protein in the wheat can cause the addiction that some people suffer when trying to quit. My sister (my grand-nephew's grandmother) claims that she had a horrible addiction to wheat and literally suffered drug-like withdrawals while trying to quit, including cravings. I have a friend whose daughter is autistic and he claimed that her condition improved greatly after her doctors took her off of gluten. So, I asked my niece to at least try to remove her son from wheat and see if he improved before submitting him to a life of drugs. Of course, her doctors insisted on the drugs and that seemed a lot easier to her. He is only eight years old and already on some mind-controlling drug. How many years will they be effective before he needs a stronger drug? All of these behavioral drugs have proven to be very addictive and become less effective over time, thereby making it necessary to increase the dose or move to a stronger drug.

I'm not sure if he is on [Ritalin](#), but it is some drug similar to Ritalin. From articles I have read, many of these shooters started out on drugs like Ritalin when they were very young. By the time they were 14 to 16, they needed to be placed on

much stronger behavioral drugs, like [Prozac](#) or some other SSRI. There are more than [four times the amount of children on these drugs](#) now than there was just ten years ago. Are we to believe that the entire human race has suddenly become depressed and in need of these modern drugs? Has the human race suddenly become deficient in Prozac? If these drugs were actually warranted and effective, then we would expect to find that all of these shooters were people who were not on SSIRs and that all the children on them were functioning citizens. I could accept the fact that a very small percentage of the population may benefit from some of these drugs, but there are millions of people taking these concoctions and many of them started taking them as children.

I believe that they are over-prescribed and in many cases just an easier way for parents to handle their children than proper discipline, exercise and a healthy diet.

There certainly seems to be a pattern emerging, but the media ignores it and the President and other politicians could care less, because they only use tragedies to further political agendas – never solutions that would actually reduce or stop the problem. After 9/11, every politician ran to push forward some bill that expanded government power and robbed us of more liberties – usually some bill that they had been unsuccessfully hawking for years, including a national ID card. Something as unconstitutional as the “Patriot Act” (completely shredding the 4th ammendment) could not have passed had it not been pushed through while emotions were high following the attacks of 9/11. No one can exploit a tragedy like a government can.

Even though there is quite a history now of school shooters who were life-long pharmaceutical addicts, it will be completely ignored by the authorities and the media. Obama will use this tragedy to pen an executive order and force another ban on some semiautomatic assault weapons, which will do absolutely nothing to slow down these school shootings.

When the next shooting transpires, the entire media circus will start again and they will find a new gun to blame for the shooting and more money will be dumped towards mental health medications, which will be shoved down the children's throats before any long-term testing will be performed.

I am not trying to make any political statement on guns here, so don't start littering my comments with anti-gun propaganda.

I am only pointing out that the politicians are not out to fix the problem. They seize these opportunities to further party agendas and in this particular case, it's gun control.

After 9/11 it was personal privacy that was targeted (because the hijackers used box cutters. Had they used guns, then guns would have also been targeted). I guarantee you that a ban on semiautomatic rifles will not make this problem go away as long as these children's minds are being twisted by these SSRI drugs of the pharmaceutical companies or the withdrawal from them. The same way that any kid can get their hands on any illegal drug if they wish, they will always be able to gain access to guns or other weapons if they so desire – no matter how many laws you write. The U.S. spends billions of dollars per year attempting to enforce the drug laws, yet any teenager knows where they can score drugs if they want them. Stop kidding yourself about the wonders of contraband and how ineffective we are at enforcing the laws that already exist.

Just like with my grand-nephew, many of these problems start with food allergies and poor health from the horrible American diet of processed foods. If these highly inflammatory foods, loaded with MSG, aspartame and other [exitotoxins](#) are not damaging enough on their little developing minds and nervous system, we then begin shoving highly addictive and mind altering pharmaceuticals into their mouths at very young ages.

I expect the problem to get much worse, no matter how many weapons we ban. Any weapon is only as dangerous as the mind that wields it. As modern food, environmental toxins and pharmaceutical drugs continue to get worse and worse, we may

see a level of crazy scarier than anything we have seen to date. That one psycho in Miami that [ate the face off a homeless guy](#) is just a taste of where we may be headed if everyone continues to ignore the real source of the problem and continues to trust these doctors and pharmaceutical companies to make your children behave. That zombie guy didn't need a gun. He was so insane that he simply used his teeth.

Let's face it, the mind that would shoot other innocent children in such a horrific nature as we have seen in recent years, is not a mind that has gone mad by any natural means.

We are seeing mental illness on a whole new level not seen since [Vlad The Impaler](#) or fictional bad men like Hannibal Lecter. I could be wrong, but I believe that they will find that this latest crazed idiot had been on these antidepressants since he was as young as the children he targeted. So far, the history of these type shootings have proven that to be the case.

Are Whole-Healthy-Grains Defenseless?

In a world full of animals that bite, claw, sting, envenomate and gore, it's nice to know that there are perfectly defenseless plants for the weak at heart to hunt. But are plants really as defenseless as they appear? We all know that there are plenty of highly toxic plants in the world, but certainly the ones we eat aren't poisonous. Think again. There

have been weapons of mass destruction created from plant toxins, like [ricin](#) (used by the Soviets during the cold war), but I know of no WMD ever derived from animals.

Every single living thing on this planet has one goal in mind – to proliferate its genetics. Nothing wants to be eaten – life has a mechanism to protect itself and its offspring. The nice thing about animals as a food source is that their defenses typically die with them. Whether it's sharp teeth, powerful jaws, stingers, horns or hooves they are no longer a threat after the animal is dispatched. Even a rattlesnake is quite edible once it is dead. Plants have evolved a much different way to protect themselves – and especially their offspring. Any species that does not develop a mechanism to protect its children would have certainly went extinct by now.

There is a major misconception that human beings existed mostly on plant foods with only a small amount of meat for supplement. I guess the conventional wisdom there is based on the idea that our human ancestors were poor at hunting. Yet, there is plenty of historical evidence of primitive hunter/gatherers hunting certain species into extinction, like the very large ruminant, [Aurochs](#). So our ancestors were not poor hunters – it is only because we have been shopping for our meat for so long, that we have lost many hunting and trapping skills of our ancestors. Given the fact that better than 99.9% of all plants on this planet are poisonous to human beings, I'm not sure how this myth has stood the test of time. I guess if something is repeated enough, people will come to believe it.

Unless the entire planet were a rainforest, it would have been impossible for humans to cover the earth as a vegetarian species. Even many of the plants we consume today are toxic to us in their raw state, especially their offspring. Beans, legumes and seeds of all kind are the future of the plant – they are the zygote from which more generations will spring forth. So why would the plant leave them undefended? They

don't. Most seeds contain lectins, which are highly toxic to most animals. The lectins of the castor bean are so lethal that they were used in the formation of the warfare chemical called [ricin](#). A dose as small as a few grains of salt is more than enough to kill an adult human. Many weapons of mass destruction have been created using plant toxins – I know of no WMD that was ever derived from an animal.

Prior to the advent of fire and the ability to make containers to cook them in, it would have been impossible for humans to consume any quantity of beans, legumes or grains. Heat can destroy the lectins in many plants, so humans were able to use them as a food source once cooking was available. But heat does little to reduce the amount of [phytic acid](#) contained within the offspring of the plant. Phytic acid binds to many minerals, such as iron, calcium, zinc and magnesium, which renders them unavailable for absorption. These precious mineral are then carried away and excreted from the body.

Only by soaking and fermenting seeds can phytic acid be reduced. Any predator that would gorge itself on the seeds of these plants, would soon find themselves depleted and deficient in many of these minerals, which can be quite problematic. And few seeds are higher in phytic acid than soybeans, which is why the Asian people only consumed soy that was heavily fermented. The massive amounts of soy inundated in all of today's processed foods is not fermented and therefore quite counter productive to good nutrition. Is it any wonder why osteoporosis is so prevalent in our time? With all of the phytates within those grains, beans and

legumes, the american people are crapping out their dietary calcium by the bucket, because it is bound to the phytates.

Then, their high carbohydrate diet further deplete calcium from their bones and teeth. Because calcium is the only way the body can neutralize the high blood acidity cause by high blood sugar, if dietary calcium is not high enough, it will rob it from the bones. Eating lots of sugar and phytic acid is a recipe for osteoporosis. This is the standard american diet (SAD).

Most antacid tablets for gastritis, such as Tums, contain mostly calcium because of its neutralizing properties. Our body also uses calcium to neutralize acidic blood, which is deadly if not neutralized. That's why I believe that it is not the cholesterol (which is flexible) that causes hardening of the arteries, but all the calcium caught in the plaque that leads to a cardiac event. Just like the Egyptians, the high carbohydrate blood level invites calcium into the bloodstream which gets caught in the plaque and lead to loss of arterial flexibility. When Mann studied the Masai, who eat tons of meat and milk, he found cholesterol plaque, but they rarely suffered heart attacks, because the cholesterol was flexible (being a fat) and allowed the arteries to expand. Mann did not find calcium deposits in their plaque, probably because of their low carbohydrate consumption, thus lower blood acidity.

The most diabolical design of these plant defenses, is that they will not kill the predator right away, especially in the absence of the lectin. If we humans were to eat raw seed, we would become very ill or die within a short time of consuming them. That was how our ancestor would have made the association that it was the seeds that were making them ill and avoided them as a food source. Once we learned that heat would prevent us from getting sick right away, then the first agriculturist civilizations determined that they would be safe to eat.

But unfortunately, there are many back-up defenses evolved

into the plants, which do not cause illness right away, thereby making it difficult for people to determine that it is the plant that is causing their failing health. Now, we have such a large part of the U.S. economy structured on the proliferation of grains, making it even more difficult for anyone to make the correlation, because they are bombarded daily with advertising telling them how super-healthy these grains, beans and legumes are. Aside from containing a butt-load of carbohydrates, grains and other seeds are a poor source of nutrition. Human cultures that had to predominantly live on grains found ways to make them easier to digest, but the process of doing so is quite laborious and time-consuming – and in today's times – not very profitable.

Because poor people had to exist mostly on grains, many of them, and especially their children, suffered from malnutrition. Because of this, the U.S. government began to mandate that flour made from grains be fortified with vitamins and minerals by their manufacturers. If grains, bean and legumes were naturally high in nutrition, then why were the poorer people, who could only afford grains, becoming sick?

And why does the government require the enrichment of cereals and flour, if they were so uber-healthy? Grains are naturally high in only one nutrient – sugar. Grains are not only very high in carbohydrates, but contain carbohydrates, such as [amylopectin-a, which spike the blood glucose levels higher than cane or beet sugar](#). Is it any wonder that diabetes has reached epidemic proportions? The U.S. government recommends 8 to 11 servings of these blood sugar spikers per day.

During his studies, Doctor Weston A. Price found civilizations whose nutrition depended on plants and grains, because of their location and lack of good hunting. Price found no civilization or tribe who thrived on a fully plant-based diet, absent of any animal foods, but he did find cultures that ate little animal foods and were able to thrive on a grain based diet. But, these people went to great length to make these

seeds digestible. They were soaked, sprouted, roasted, ground and then fermented (creating sourdough) before baking them into bread or cakes. Very few people today ferment grains or beans, because it is a time-consuming process and not very profitable to the process food manufacturers. Even sourdough bread commercially sold are rarely fermented and have sour additives for sour flavor. If you have ever eaten fermented sourdough bread, you would find them far more sour than any commercial bread advertised as sourdough.

It is far more likely that most of our ancestors prized meat and animal products far above plant foods for its higher nutrition and better safety from toxins, which is why we still call vegetables a side-dish to this day. Plants were much easier to acquire, so they would have sought after meat as a first priority and simply settle for plants if meat was not readily available and if a hunt was successful, they would supplement or cook the vegetation with the meat. But, grains were simply not a part of the paleolithic man's diet until the technology was discovered to make them safe to eat, which only occurred about 10,000 years ago – just a fraction of the time that humans have been around. Early grain eating societies, like the Egyptians, have recently been diagnosed with massive calcium deposits in their arteries at ages of 40 to 50 years old. CT scans of ancient mummies has revealed dangerous levels of atherosclerosis. ([source](#)) ([source](#)) ([source](#)).

Remember, these were active people, who ate very little animal fat (usually geese) and got plenty of sunshine. But the Egyptians loved wheat. They made cakes, smothered in honey and were the inventors of beer from barley and consumed it as the hydration drink of choice. Was it their love of wheat that was killing them? I believe so.

The soybean had a much more diabolical defense to unleash on its predators. The seed of the soy plant contains very high levels of phytoestrogens. The purpose of these plant-based estrogen is to cause the insects that dine on them to

ultimately become sterile, so the parents may feast on the seeds, but there will be a lot fewer offspring of the predator in the future. The soybean has evolved its own birth control for those that would eat its young – after all, birth control pills are just estrogen. These high doses of estrogen can be very problematic for humans, causing breast cancer and young women to enter puberty at a very young age and the boys will not enter puberty until a much older ages.

Peek into your pantry and read some of the processed food labels and you will be amazed how many products contain unfermented soy products. Even most tuna fish cans will list soy as an ingredient. If you are eating tuna to obtain more omega 3 fatty acids, they have tricked you by adding omega 6 soybean as filler. (you can get tuna without soy, but it's a bit more expensive.). You are probably consuming mass quantities of unfermented soy – why? Because soy was a necessary plant used in crop rotation to replenish nitrogen into the soil, so they had to find a way to market it. The government subsidizes farmers that grow it, so its cheap filler for all processed foods – and is making us sick. It makes cattle and chickens sick, why does anyone believe that it is a health food? A lot of heavy advertising and marketing brainwashing.

Fruits evolved a completely different mechanism. The fruit is not a zygote, but actually the ovary of the plant. The ovary is purposely designed to be high in nutrition and sweet and juicy, because the plant actually wants a predator to eat the fruit. The seeds of the fruit are completely indigestible, so the plant willfully surrenders its delicious ovary so it will be replanted somewhere else when the predator takes a dump.

But only a fool would decide to grind up the seed of the fruit and make a bread or cake from the flour. We know that the seeds of most fruits are highly toxic and many can kill a human in short order if made digestible and eaten in quantity.

If we all know this, then why are we convinced that the seeds

of other plants are so defenseless, just waiting to be plucked, cooked and eaten? They are not.

If seeds are left so defenseless, I defy anyone to grind up some apricot and apple seeds, make a flour and bake it into a cookie and eat it. It will be the last thing you will ever eat. Apricots seeds and apple seeds both contain hydrogen cyanide. If swallowed, they are harmless, because we cannot digest them and they will safely pass through us. One seed crushed may not kill you, but could make you feel ill.

Several seeds ground up into a flour is certain death to those that dare to eat it. Plants do and will defend their babies as ferociously as any mother bear would defend her cubs.

Many birds and insects have evolved mechanisms to deal with the toxins in grains. Rodents seem to be one of the only mammals that can thrive on grains. One thing that all of these animals have in common is a very fast metabolism – humans do not. Any wonder why the problems with obesity in the modern world? We are eating foods intended for animals with heart beats and metabolisms 8 to 10 times that of a human. We cannot possibly burn the calories per hour that these animals have to. A humming-bird must dine on pure sugar, but unless you can flap your arms at 80 times per second all day and maintain a heartbeat of 1,200 beats per minute (the human heart would explode) then you can share in their diet. Problem is, humans are consuming the calories from sugar at the rate of a humming-bird, with our 74 beat per minute heart rate. Hmmm. wonder why so many are obese.

As far as plant toxins, many species of birds are known to first consume types of clay prior to eating some of these poisonous grains and berries. Minerals in the clay can chelate to the toxins and safely remove them. Humans have no such system yet continue to eat unfermented grains by the pound. Doughnuts, bagels, pasta, snack cakes, chips – all loaded with these anti-nutrients which rob minerals from your body. The plants will win the battle in the long run, as all

of humanity, eating 8 to 11 servings of these heavily defended offspring, playing a game of diabolical chemical warfare on your system, continue to make the human race fatter and sicker (think diabetes).

These little monsters are also reeking havoc on our digestive system, as the gluten protein wear away at your intestinal villi, shrinking them back and opening huge holes in the intestinal mucosa. Once this happens, large proteins can be absorbed into the bloodstream and cause many autoimmune disease. Celiacs, Crohn's, Ulcerative Colitis have been on the steady rising and there is no cure known for these diseases, other than cessation from grains, but few doctors will go against the zeitgeist of the huge advertising of the giant agribusiness (who own the USDA) and will continue to recommend that these IBD patients increase their grain consumption. Every new study has proven what IBD sufferers already knew, grain fibers make their condition worse. Though most doctors (who tend to be behind the times) still recommend insoluble fiber from grains, new studies have shown this to be counterproductive, causing gas, bloating, obstructions and bleeding in patients. Read the testimonies [here](#) from some IBD patients talking about the horrible results they suffered when following a doctor's advice to include indigestible psyllium from grains) into their diet. I had similar experience with insoluble fiber as they had.

Don't fool yourself into believing that these people are some how different or from another planet. (basically saying, "it sucks to be them"). I consider them and me to simply be a more sensitive meter. Similar damages are being perpetrated on your gut at a slower degradation, but it's there. If you do not believe me, take a scan of the gastric medicine isle at your local pharmacy or even Walmart or Target. Look at all the different OTC medications for GERD, constipation, diarrhea, gas, enzymes for digestion (such as beano) and indigestion. Someone must be buying this crap, or these

stores would not stock so much of it. How many times a week do you take one of these products?

Our ancestors did not have access to such OTCs, so they had to learn to avoid or better prepare foods that caused these problems. Now people feel free to indulge in any crap they want and then pop some protonic or other digestive aid. Is this really healthy? The damage is still being done and you may well develop an IBD or colorectal cancer at some point.

Grain fiber WILL NOT prevent colorectal cancer as the heavy advertising from the agribusiness has brainwashed everyone – in fact, I believe it has instigated the higher numbers of cases now than we had 100 years ago. We would have less reason to risk people's lives with dangerous procedures, like [colonoscopies](#), if grain eating (especially whole grain with the indigestible husks) were not the predominant food of choice.

I believe that colorectal cancer rates would dive bomb and the fear would not be so great as to scare people into risking their lives for colorectal screening (please read my post "[The Dangers Of Colonoscopies](#)") that kills and disables so many at much younger ages than anyone would ever develop cancer.

Ruminant animals, such as cattle, get very sick and will die on a grain based diet if not given antibiotics. It must have been brilliant marketing to convince what is supposed to be intelligent people that the same grain used to fatten cattle, which makes them sick and in need of daily antibiotic injections, would somehow make humans slim and healthy. As should have been predicted, these grains also made humans fat and sick – any wonder why.

Dogs and cats have begun to develop many of the same diseases afflicting humans when fed a grain based diet, and most modern pet foods, made for these carnivores, is made mostly from grains. Now it is quite common to see obesity, diabetes and even cancer in our pets. Someone felt it was a great idea to base most of our dietary studies using rodents, which is why I pay little attention to any study which based their study on rats. They are possibly one of the only mammals that have evolved to eat grains and are therefore a very poor analog for humans, who have not developed such a mechanism to deal with the problems offered by grains.

Historically, grains were mostly reserved for the poor as a dietary base and the poor have historically always been sick – therefore why the government mandated the addition of man-made nutrients into the cereal and flour (think agribusiness, like Monsanto, and cereal companies who give huge grants to the USDA and actually have ex-employees appointed to positions in the FDA and USDA). If a diet rich in grains were the healthiest diet, then the impoverish people would have enjoyed the better health over the rich people who ate so much more animal fat. This was never the case. How have people of means, in one of the richest nations in the world, been convinced that the diet historically eaten by the poor and sickly was the diet best for the human being escapes me? A masterful brainwashing indeed.

These grasses have not been around for millions of years by waving around naked and undefended from predators, with all that sugar available for easy food. They evolved to reduce their predators population and unfortunately we are now the predator. Their highly bioavailable sugars promote visceral fat, which in turn drive hormones, such as [leptin](#) (messes up the brain's ability to determine satiation) and [insulin](#) (which drives fat to be stored), rendering the predator into a perpetual hunger needing more and more and satisfaction is never achieved. As a result, this predator suffers obesity,

diabetes; which leads to heart disease and cancer and a whole host of gastric and digestive malfunctions.

This is all driven by the billions of dollars of advertising and influence of the large agribusiness, bread and cereal companies to market their highly profitable, government subsidized, genetically engineered and patented franken-plants. They have successfully convinced people, politicians and medical personnel that these foods, that are at the heart of most of the american health problems, are the healthiest foods that humans have evolved to eat. How could a species evolved to thrive on such a strange food they never consumed for 99% of their existence in less than 10,000 years?

The plant's diabolical defenses, that still remain lethal far after harvest, are winning the battle for survival. They were here before humans and will be here long after humans are gone. Their purpose is to reduce the population of their predator and it seems that they are on their way to achieving that goal.

If you read my post entitled, "[Are Humans Living Longer Than Ever Before](#)", it explains how poor nutrition killed the impoverish en mass. The poverty-stricken people over 100 years ago had no choice but to attempt to live on flour and sugar for calories, which were very low in available nutrients, thus succumb to malnutrition and other diseases of deficiencies, such as [beriberi](#), [rickets](#) and even [scurvy](#). This was why the U.S. government mandated that all grain flour and cereal would have to be fortified or enriched with man-made vitamins. The health of the poor did improve as a result, so it was a success, but still did not enjoy the health that those of means, who were able to eat animal foods, did. The enriched flour is typically inundated with mostly B vitamins, because they can stand the heat of cooking, but still lack vitamin C (which is heat sensitive) and vitamin D3, the most important for human health. These are also man-made vitamins and there are many questions as to their bioavailability,

especially after being baked in excess of 350°F and even higher temperatures when extruded to make cereal flakes and other shapes, where proteins are denatured and vitamins are destroyed.

My next rant will concern the large agribusiness and bioengineering companies, like Monsanto and where I believe that their future goals are and how they will affect us. I hope you will return to read it. It should be finished in a few days. I would like to thank all my readers and especially those who have provided links to some of my articles and help spread the word on the very important information concerning colonoscopy dangers and the fact that intestinal transplants are possible and can give back life to those stuck on TPN.

Together we can make a difference, even if small, we can certainly save some lives.

Are Humans Living Longer Than Ever Before?

Humans live longer now than any time in known history. Is this commonly recited statement true? From a purely statistical standpoint, the answer is simple – yes. So why do I have so many paragraphs left in this article?

Because statistics can be deceiving and without further investigation we can be led to some pretty erroneous conclusions.

Statistics are based on averages, so anyone in a population that dies extremely young (like an infant), will dramatically offset the figures of those who lived to a ripe old age. Infant mortality rates were very high in antiquity, so when all the numbers are crunched, the average figure for a society's mortality rate will often end up between their 40s-50s. The modern statistical average for the United States has been reported to be 78.2 years (75.6 for males, 80.8 for females). When you add in the rest of the world, that average drops to 66.57. This huge drop is due to the addition of non-industrialized nations who also suffer high infant mortality rates.

Genetically, we are no different than our most ancient ancestors and they were not preprogrammed to self-destruct at the age of 40, like is so commonly believed. I would like to address three irritating myths regarding this subject or at least the ignorant arguments I have encountered when discussing this subject.

MYTH #1

Many people seem to believe that everyone dropped dead at the age of 40 – 45 prior to the 20th century. I have heard too many people confidently make this claim. They heard the statistic and simply assumed that everyone prior to the 20th century would have received their AARP membership at the age

of 25. I am joking about the AARP, but if everyone assumes that people died of natural causes at the age of 45, then certainly 25 would be considered over-the-hill and time for the depends undergarments.

MYTH #2

Many people credit our modern longevity to medical advancements. Other technologies have been a greater contributor to human longevity than medical. Modern medicine has helped to lengthen the lives of some people, but has also prematurely cut short many lives, considering that [adverse drug reactions](#) are the leading killer of humans in the U.S. and medical errors is the third leading cause of premature death (for more details on this please read my posts under the category "[Medical Mayhem](#)" – especially "[The Dangers In Modern Medicine](#)", "[How Common Are Medical Errors](#)" and "[The Dangers Of Colonoscopies](#)").

MYTH #3

Many of these same people use this statistic to support the idea that we eat healthier now and thereby live longer. People died younger because they ate all that animal fat. This proves that they have not given this subject much thought or research or they would know that heart disease and cancer were very rare just 100 years ago, so how could saturated fat be the cause of premature death?

I would assume that the average american has a difficult time understanding math and statistics. If this weren't true, no one would buy lottery tickets or toss money down the drain at casinos. It is true that according to statistical averages, people died much younger prior to the 20th century. But the truth is, that their lives were taken by completely different causes than today. It was not cancer, diabetes or heart disease that was killing most people in times past. So what was killing them so young? Let's take a look at what were the

major causes of death in centuries past and see why other technologies played a greater role than medicine.

Starvation and Malnutrition

Probably the single highest killer of human beings throughout history. Due to droughts, locusts, floods, poverty and even war, food could be extremely scarce at times and millions of people died as a result. Children are far more vulnerable to [kwashiorkor](#). Malnourished mothers have a higher likelihood of losing their babies, so infant mortality rates were very high among the poor as was the death of mothers giving birth (who were much younger than many mothers today). It was advancements in agriculture, distribution methods and food preservation that made it possible to get the food from one location to the area where the disaster had struck.

Communicable Diseases and Plagues

Bubonic plague, scarlet fever, small pox and a whole host of diseases wiped out many humans and once again, hit children the hardest because of their developing immune system. Medical advancements did less to help with this problem than did improved sanitation. When the garbage dump is located in the middle of town and human and animal excrement runs through the city streets, disease and plagues are inevitable. Finding a clean water supply also saved millions of lives. People in the past often drank extremely contaminated water. While visiting Saint Augustine, Florida recently, we noticed that many of the houses had [cisterns](#) in the basement that were filled from drainage of rain water from the roof. This was how they obtained their drinking water and attempted to purify it by adding chalk to the water. Many of the diseases that killed people in mass are still incurable to this day – we only prevent them by not living like pigs.

Infection

This is still one of the top killer of humans, but far, far less than before the advent of penicillin and more advanced antibiotics. Minor infections, which can now be cleared up with a simple antibiotic before going systemic, often became lethal in the past. Hunting and farming were both dangerous occupations that carried a high risk of injury, so many healthy people died as a result of an infection from even superficial wounds. Antibiotics and vaccines are the one area where modern medicine has saved millions of lives – unfortunately, we are now at a point where overuse of these drugs are quickly becoming a greater threat to human health.

Hospital borne pathogens are now becoming resistant to most antibiotics.

War

It seems that the further we go back in history, the higher the death toll from war becomes. In the ancient times of [melee warfare](#), the idea was to simply overwhelm your enemy with sheer numbers. If you found you were outnumbered, retreat became a suicidal option. Armies were engaged at such a close range, that turning your back on your opponent was certain death, so casualties were very high. These were very young men dying – much younger than today's soldiers.

My wife and I were recently in Saint Augustine and took a tour of [Fort Matanza](#) where the Ranger informed us that the Spanish artillery soldiers started training at the age of 10, so they would be experts on the cannons by the age of 14. These deaths were often very young men losing their life (12 – 25), which would bring down the lifespan averages quickly.

We no longer have the stomach for the same level of losses from war as our ancestors did. Because of our ability to strike with accuracy from greater and greater distances, we

suffer far fewer casualties. In the near future, more drones will be used in warfare, so we should see the death tolls from war decrease – at least on one side. In today's modern warfare, the U.S. will lose less than a thousand soldiers within a year of war, whereas in the past they could lose over a thousand soldiers in a single battle lasting only a day or two.

For example, the U.S. has been at war in Iraq and Afghanistan for ten years now and the U.S. death toll is around 4,486. There were 3,108 Confederate soldiers killed in three days, on July 1 – 3, 1863 at Gettysburg. There were over 110,000 Union soldiers killed in combat throughout the Civil War and a total of 360,000 total deaths to just Union soldiers. These were very young men dying, so the average lifespan figures take quite a hit during periods of war.

Though modern medicine has contributed somewhat to the lower mortality rates from injury due to war, it is certainly the technology of the weapons and armor that has lessened the toll.

We can see that other technologies played a greater role in extending human lifespan than did modern medicine. At least where our ancestor's causes of death were concerned. This is where this all gets rather ironic. If we examine this subject more closely than just a simple statistic or quick sound bite that we heard, we would see a completely different set of problems between then and now. We now NEED medical intervention just to reach the ages that our ancestors would have, if they could have averted the problems that we have now solved (in the industrialized world). How do I know that they would have lived as long? Because many of them did, AND without any serious medical intervention.

In order to look at this clearly, we have to stop looking at the population as a whole and using averages to fool ourselves

into the idea that we have improved our lifespan and quality of life so much more than the generations that preceded us.

In order to do this we must remove the impoverished from the equation. Someone who lives in poverty today have a lot less problems than those of antiquity. Here in the U.S., even the most poor among us can get access to food and medicine, something unheard of in times past. This alone makes the average lifespan appear that everyone is living comfortably into our late seventies and eighties, while creating the illusion that everyone dropped dead at the age of forty in the past. Many bloggers (vegans and paleo dieters) love to debate about the diet and life-span of paleolithic humans, but we have little record from that period to really make a strong argument. For the purpose of this article, I would like to look back around 200 years ago in the United States as compared to the last couple of decades. This way we are looking at people from similar culture and genetic backgrounds.

The argument I often hear when the fact that heart disease, diabetes, cancer and other diseases were so rare 200 years ago, is that because they died so young, no one lived to an old enough age to succumb to today's top killers. That excuse is beginning to run pretty thin now that we are seeing a higher frequency of these diseases in children. Obese and diabetic children were pretty much non-existent in the U.S. 200 years ago. What are the differences in the common diet then and now?

COOKING OIL: Two centuries ago, there were no processed vegetable oils, especially hydrogenated oils that mimic the properties of saturated fats (the hydrogenation process was not discovered until the beginning of the 20th century).

Everything prior to 1900 was pretty much cooked in saturated fats such as butter, lard and tallow or tropical oils like palm or coconut. Given today's belief, and governmental dietary recommendations, obesity and diabetes

should have been rampant in children at that time with the diet being so rich in animal fat – yet it was not. Americans consume far less animal fat than they did just 50 years ago. Butter and lard consumption is a fraction of what it was prior to the war-on-fat started in the 1970s by the U.S. government. Since then, margarine replaced butter and Crisco took the place of lard. These are highly inflammatory [trans fat](#) and are used in nearly all processed foods.

SUGAR: Sugar consumption was very low in the 18th and 19th century. The average american consumed less than 30 pounds of sugar per year, whereas the average child today can eat as much as 150 pounds of sugar per year – and this is simply calculating the refined sugar and corn syrup consumed and does not account for the higher amount of starch consumed presently (8-11 servings of starchy grains). Modern grains have been bred to have a much higher carbohydrate content than grains from just 100 years ago. By the time today's children reach 50 years of age, they will have consumed over 8,750 pounds of refined sugar – that's more than 4 tons of sugar cycled through their arteries.

MODERN WHEAT: Today's wheat is nothing like its ancestor. The modern high-yield, semi-dwarf wheat used today in processed foods and baked goods is a genetic hybrid of its ancestors. This wheat was not introduced into the human food supply until the 1960s and became 98% of the wheat supply by the 1980s. Since the 1980s, there has been a quadrupling of Celiac's Disease and many other intestinal disorders, such as [Crohn's Disease](#), [Ulcerative Colitis](#) and other forms of [IBS](#) have been steadily on the rise. Researchers have found many other gluten intolerant diseases in patients other than [Celiac Disease](#) and have identified certain antibodies created by many people's immune systems with the sole purpose of attacking wheat gluten ([link](#)). These antibodies are responsible for many

other autoimmune diseases, such as [Rheumatoid Arthritis](#) (since dropping wheat from my diet, all of my joint pains slowly disappeared over the first year) . Here is a quote from a website called The Natural Recovery Plan.com (click [here](#) to read the entire article):

The hybridisation and genetic engineering of wheat has resulted in a staggering 500 fold increase in the gluten content of modern-day wheats compared to the wheat our forefathers would have known and this may be one of the prime reasons behind the massive rise in incidence of gluten intolerance and coeliac disease in recent decades."

If you wish to read one of the best detailed research on the history of our modern wheat and the problems that have possibly arisen from it, I highly recommend Dr. William Davis' terrific book "Wheat Belly" and visit his site [here](#).

These are just some of the differences in diet from the 19th to the 20th century. Both sugar and vegetable oil (containing mostly linoleic acid) are highly inflammatory to the human body, especially the arteries. To read my documented accounts of the damage I have seen from linoleic acid that is infused to TPN patients, please read my article, ["The Truth About Soy"](#). I also have a detailed article on the damage I experienced from the high sugar content infused with the TPN entitled ["The Effects Of Sugar On The Arteries"](#). Besides seed oils and sugar, there are many other variables to consider, such as flavor enhancers (MSG and artificial sweeteners), preservatives, coloring and let us not forget GMOs (genetically modified organisms), such as "Round Up Ready Seeds" by Monsanto. (I will be covering this in an upcoming article).

It is not inevitable that our ancestors would have suffered the same fates as our seniors today had they lived longer. To

be fair, I decided to look at a very small group of men who would have lived similar lifestyles. Let's take a look at U.S. Presidents and you may find it quite surprising. If we look at the first 5 presidents, we will see that they all lived well beyond the age that those diseases should have showed up in one or more of them.

George Washington – 67

John Adams – 90

Thomas Jefferson – 83

James Madison – 73

James Monroe – 80

I wonder why these men didn't drop dead at 40? John Adams was 61 years old when he was inaugurated. Why would the people vote in a president who was already past the average life-span of a human? Because these were men of means, they were able to avert all of the other problems that killed poorer people in huge numbers. Starvation, poor sanitation and infections were less of a threat to someone above the poverty level (safer occupations), so these men lived to ripe old ages. George Washington is the youngest death in this list, but he did not die of natural causes. Washington was bled to death by his doctor (medical errors were killing people prematurely even then). Had he not been bled to death, he still may well have died anyway, because he had a respiratory infection and this was a time before antibiotics. Even so, he still lived to the age of 67 (my father had his first heart attack at the age of 66 and without the use of [stents](#), it would have been a fatal heart attack). Let's take a look at the last 5 presidents (excluding Obama, because he is still too young to know his fate).

Jimmy Carter – Still living at 88

Ronald Reagan – 93

George H. W. Bush – Still living at 88

Bill Clinton – Still living at 66

George W. Bush – Still living at 66

Ronald Reagan is the only one who has passed on – and he was 93 at the time. So why would I list these last 5 when the only one that died was older than any of the first 5 presidents and the rest are still alive, even beyond the average age of death? Because I wanted to take a more detailed look to determine if all of these men would still be alive had they not had the modern medicine and procedures we have today. The bigger question that we have to ask ourselves is how in the hell did the first 5 presidents live to those ages without medical intervention – especially with all that animal fat they ate daily? Remember, even a ruptured appendix or gall bladder would have taken their life at that time.

Certainly with modern antibiotics, George Washington would have survived the influenza and may well have lived as long as John Adams or possibly longer.

Ronald Reagan did live to the age of 93, but also had a serious tumor surgically removed from his colon in 1985 – without treatment he may have died many years earlier. Reagan also suffered with Alzheimer's disease for at least the last decade of his life and many believe he began suffering signs of the disease even while serving as President. Without medical intervention, he certainly would have died at a much younger age. There is no record that Adams was not of sound mind ([John Adam's health history](#)). Most all of the founders were very active even late into their lives. George H. W. Bush now suffers from vascular Parkinsonism and is confined to a wheelchair, John Adams was not in a wheelchair at 88. Bush Sr. also underwent a procedure to reduce his thyroid gland (radioactive iodine), because he suffered with [Graves](#)

[disease](#) (the doctors overdosed him, destroying too much of the gland. Since then his life has been dependent on hormone medications). Adams also suffered hyperthyroidism, but his went untreated.

Bill Clinton is still with us, but clearly would not be without modern medicine. Clinton began having cardiovascular health problems at the age of 48 and underwent a coronary bypass surgery at the age of 58. It would be safe to say that Bill Clinton would have most likely never seen the age of 60 without modern medicine.

George W. Bush had precancerous skin lesions removed from his skin a few times. Of course we are told this was caused by that enemy-in-the-sky we call the sun – which was strictly put there to kill us. Could Bush have actually had more sun exposure than Andrew Jackson, who led his troops throughout subtropical states like Louisiana and Florida? “W” has had access to sunscreen his entire life, Jackson did not and lived to the ripe old age of 78 with a lead bullet imbedded in his chest from a duel he had while in his forties ([Jackson's health record](#)). Bush could have died from cancer far before the age of 65 – and he didn't have a bullet stuck in his chest for more than 30 years. Jackson had no access to sunscreen while in the hot Florida sun. Sunscreen could likely contribute to the high number of melanomas seen today, but it's extremely profitable to the manufacturers (I'll save that for another rant).

Many people today would never see their 60th birthday without some sort of medical intervention. So even though we solved all of the killers that plagued our ancestors, we found a way to level the playing field by creating a whole new set of killers. Though we have invented medications, treatment and procedures for many of them, they hardly improve on the quality of life. We may live longer, statistically, but we live sickly, racked with pain and dependent on medications

starting at middle age. If we could improve our lifestyle and eat real food, like our ancestors, we could possibly live longer and with more vitality than ever before in history.

Had our ancestors eaten the crap we do, without our modern medicine, their lifespans would have been much shorter and we may not have even survived as a race.

Modern technology has given us toxic food, but plenty of medications, surgeries and other medical procedures to keep us breathing well into our decrepit eighties. Unfortunately, the party is about to be over. The medicine is not improving at the same rate that our diet and lifestyle is decaying. We are beginning to see a [shortening of the average lifespan](#) that I believe will continue if something drastic is not done to fix the standard american diet (SAD). I will continue with more evidence on this in an upcoming post. I apologize for not posting anything in a while. I actually have dozens of drafts written that I simply haven't had time to proof read and edit, so the next several articles should follow very shortly. Thank you for your patience.

The Wonderful World Of Disney Hypocrisy

©RoarOfWolverine.com

In 1998, the Copyright Term Extension Act was being debated by the U.S. Congress, which lengthened the amount of years before a copyrighted material would enter into the public domain. The law would extend the life of a copyright for works of a corporate nature from 70 years to 95 years!

The law was known as the ["Sonny Bono Term Extension Act"](#), but was pejoratively called the "Mickey Mouse Protection Act", because The Disney Corporation was the biggest driving force behind the Lobby. Why? Because Mickey Mouse was nearing the 70 year mark and would soon enter the public domain. Many other early Disney characters would soon follow, as their copyright expiration dates were closing fast. This would be a huge financial blow to the Disney brand, so it would reason that they would lead this crusade.

Congress awarded the extension in 1998, and I'm quite sure that Disney's 6.3 million dollars in campaign donations between 1997-1998 had no bearing on the decision. Congress overstepped its power and ruled in favor of corporate welfare rather than their sworn duty to the promotion of "progress", as written in the Constitution Article 1, Section 8:

The Congress shall have Power... To promote the Progress of Science and useful Arts, by securing for limited Times to Authors and Inventors the exclusive Right to their respective Writings and Discoveries;

I might not have a problem with Disney's action, had their corporation built its vast empire on originally created material. The fact that Disney used prior works as a springboard to success envelops this all in the stench of

hypocrisy. The Disney company had a moderate level of success with the original characters featured in early black and white short films. Disney did not really hit stride until making full length animated features. Giving credit where due, “Fantasia” was original Disney characters and story line, if you want to call it that. “Fantasia” was literally a series of short animated stories edited together to a soundtrack made up of mostly public domain music for which Disney paid no license (with the exception of “The Rite Of Spring”).

From there on, most Disney feature animations would be based on stories that had since fallen into public domain. Snow White, Cinderella, Sleeping Beauty and many other princess stories, were based on age-old fairy tales that Disney was not required to pay license or royalties for. Later works would include children’s literature like: “Pinocchio”, “Alice in Wonderland” , “The Jungle Book” (released just one year after Kipling’s copyright expired),— All in the public domain! Disney didn’t pay a cent for story license, yet reaped many millions. The “Little Mermaid”, “Beauty and the Beast”, “Aladdin” and all features made under the reign of Michael Eisner, would be from public domain. Of course, Disney touted “The Lion King” as an original story. Not! Besides being an adaptation of Shakespeare’s “Hamlet” told through a pride of lions, there are way too many similarities between The Lion King and a 1960s Japanese animated series called [“Kimba the White Lion”](#). Though Disney claims these a coincidence, they would sue anyone else into oblivion if they came half as close to one of their properties. The clip below illustrates just how “original” Disney’s “The Lion King” really is.

Disney has had few original productions not based on time-tested classics, and when they do, they often flopped big time. The “Aristocats” would be an example.

(Do not confuse Disney with Pixar. Pixar is the brain-child of John Lasseter and had its own talented writing staff, who

penned awesome original stories. Disney was only Pixar's distributor, until they bought them in Jan. 25, 2006. Pixar is still Lasseter's project, with its own writers.)

Hey, Disney, have you ever heard of "sending the elevator back down"? They built an empire off of other people's intellectual properties and then sue daycare centers, who dare place any Disney image in the classrooms or playgrounds (real case, [Hallandale, Fl, 1989](#)). Then Disney has the audacity to purchase copyrights on the characters they liberated from the public domain. Yes, they didn't create the characters, but they now own the iconic image that they created to represent them. Anything even remotely resembling them, they will attack with the ferocity of a pack of hyenas.

During the airing of The Oscars in 1989, a musical skit was performed with a singing Snow White (portrayed by singer-dancer Eileen Bowman). [Disney actually sued the Academy of Motion Pictures and Sciences](#) for having a character wearing a similar wig and costume to the Disney movie version. The character named [Snow White](#) has origins as far back as the middle ages, yet Disney thinks they now own her. When it was discovered that someone else (other than Disney) probably [held the copyright for Bambi](#), Disney began throwing out ridiculous legal concepts to come up with *anything* that would get the copyright out of the hands of this other potential owner – including the claim that Bambi was in the public domain *AND* that Disney owned the copyright to it.

No matter how long something has lived in the public domain, if Disney makes an animated version of it, it now belongs to them. So, if Disney makes an animated version of the Bible or Koran, they will own those characters as well. I can see the headlines now: "Disney versus the State of Islam over rights to Muhammad", followed by images of planes crashing into Cinderella's Castle in Orlando.

Of course Disney is not as adamant about paying royalties as they are at collecting. Disney attempted to stiff singer [Peggy Lee](#) for the royalties for her voice work in “Lady and The Tramp” when it was released for home video in 1987.

Disney claimed that her original contract, signed in 1952, which gave her the right to participate in “transcriptions for sales to the public”, did not specifically cover “home video” sales. The idea of home video technology did not exist in 1952! Thankfully, the [courts ruled](#) in favor of the seventy year old Lee.

Our nation’s founders did not consider inventions and artistic expression as property, but as public goods to which exclusive rights might be granted for a limited time as purely a means of incentive for production. Thomas Jefferson expressed this sentiment in a letter written in 1813:

If nature has made any one thing less susceptible than all others of exclusive property, it is the action of the thinking power called an idea, which an individual may exclusively possess as long as he keeps it to himself; but the moment it is divulged, it forces itself into the possession of every one, and the receiver cannot dispossess himself of it. Its peculiar character, too, is that no one possesses the less, because every other possesses the whole of it. He who receives an idea from me, receives instruction himself without lessening mine; as he who lights his taper at mine, receives light without darkening me

Inventions then cannot, in nature, be a subject of property. Society may give an exclusive right to the profits arising from them, as an encouragement to men to pursue ideas which may produce utility, but this may or may not be done, according to the will and convenience of the society, without claim or complaint from anybody.” – Thomas Jefferson

Thomas Jefferson and James Madison went as far as to consider

such copyright hoarding as a monopoly and we all know how the framers of our Constitution felt concerning monopolies. Jefferson wrote:

Monopolies may be allowed to persons for their own productions in literature, and their own inventions in the arts, for a term not exceeding ____ years, but no longer term, and for no other purpose.” – Thomas Jefferson.

The blank in the quotation was left to be filled in later by an agreed upon vote, but certainly not the 95 years Congress has now awarded. For more information on Jefferson's attitude concerning copyrights read [here](#).

Jefferson, being a literary writer, [inventor](#) and [musician](#) himself, reluctantly believed that the creator of an intellectually property should be rewarded for an acceptable time, just to give incentive to create. But he also felt that ownership should not transfer to family or companies for eternally long periods. He knew that this promotes hoarding of intellectual properties, only for sale or view for the wealthy. These works need to eventually become part of history and education FOR ALL!

What if Mozart, Da Vinci, Dickens, Shakespeare and the likes, were still privately held? How would people of little means gain access and knowledge? It is not in the best interest of a society to withhold knowledge and art from those of lesser means. Can we see even Disney's classic works for free?

Hardly. This is exactly what our founders did not want.

It is obviously Disney's intention that their properties NEVER fall into public domain. You can bet that Disney will again barter congress for more extensions once their new deadline comes to term, thereby preventing anyone else from duplicating what Walt did. Is this fair? Even Shakespeare built on the prior works of Holingshead's *Chronicles of England* (1573).

Had these idiotic perpetual copyright extensions existed then, we would not have Shakespeare or many other great works

that have help the “progress” of society.

If Disney ‘s 75 year old creations were rightfully allowed to fall into public domain, then other artists could use that art to build new forms of art from it, just as Disney did with old fairy tales and children’s literature. And, what if the creators of all those fairy tales and children’s literature would have bought government favor to extend the copyrights on their work? They would have charged Disney huge license fees and royalties to use them or refused usage out right (like Disney often does). Of course Walt could not have afforded the license fees as a start-up animation company. With Walt being a man of few original ideas, the Disney company would be just another hack animation company publishing cheap Flash animated shorts on YouTube and history would be forever changed. How is Disney’s greed now affecting the future?

Can We Feed The World?

“We could feed the world” is the anthem of everyone who supports the proliferation of massive mono-cropping of wheat and other grains. Vegetarians and vegans use this phrase as if it were the exclamation point ending every sentence. The theory is that if we didn’t feed so much grain to livestock, we could feed the world with those grains. That’s

fine with me, because I don’t consume products made from grains nor from livestock raised on grains. All livestock animals, including cattle, sheep, goats and even chickens didn’t evolve to eat a grain based diet and their health suffers as a consequence. [Feedlot](#) animals require antibiotics to stay alive and render inferior food products. The reason grains are fed to livestock is simple – to fatten them up for slaughter

quicker. Yet, somehow [TPTB](#) have convinced people that these same “Heart Healthy Grains” that make livestock fat and sick will somehow make humans lean and healthy. How’s that working out for us so far?

So if we were to allow livestock ruminants to thrive on their natural diets of grasses, would we truly feed the world with all that extra grain? We actually produce enough food now to feed the world, even in spite of the grains fed to farm animals. Excess grains are purchased to

produce tons of processed foods, snacks and other confections.

Corn is processed into high fructose corn syrup for sodas, juices and a whole host of processed swill. Wheat is used for the baking of snack cakes, cookies, pies, donuts and every other baked goodies you can think of. Tons of grains

are used annually in the brewing and distillation of alcoholic beverages.

Funny, I have never heard anyone reciting; “If we just gave up junk food, sodas and beer, we could feed the world.”. And it goes far beyond edible products. Grains have thousands of industrial uses. Wheat is used to make industrial adhesives, soaps, cosmetics and many other products.

So much grain is produced in the world, that inventors stay up nights designing more products that can utilize them – we even burn them as fuel. Why are they not being used to “feed the world”? The answer is simple economics. Selling grains to the impoverished is less profitable than selling Little Debbie Snack Cakes to people with money to burn. We also have the problem of dictatorships. Many starving people live in nations where their leaders are the cause of their starvation. These dictators and warlords can use hunger as a weapon to control their populace or sell grains on the world market in exchange for weapons, fuel or any other commodity that will empower them, rather than distribute the food to their people.

When first world nations, such as the U.S., have sent tons of grains into starving countries, the cheaper cost of the imported grains only served

to put the local farmers out of business. The poverty-stricken farmers cannot afford the huge tractors, combines, irrigation, petroleum fertilizers, pesticides, fungicides and herbicides that make agriculture more abundant in the U.S., not to mention the government subsidizing, which lowers the cost. They are often times driven out of work and have to abandon their farms. This huge inflow of grains to the market has historically proven to only cause more starvation and disruption of the local economy.

Some people live in a fantasy world, where simply reducing or abstaining from animal products will somehow “feed the world”. This is a pretty anemic effort which may somehow boost their self-righteousness, but does nothing to solve the problem. If there is no profit in raising grain crops, growers will simply stop raising them and go into a more lucrative venture. Plenty of U.S. Tax dollars go to shipping grains to third world nations only to make their governments fatter, not the people. How is dropping meat from your diet going to change that? Are those people suggesting that we overthrow every rogue government in the world and occupy their country? Should we behave as an empire? Truth is, such idealists have never given it enough thought to understand why there are starving people. They are the masters of “soundbite recital” and it becomes that much more laughable when it comes from a rotund individual.

LOSE THE WHEAT, LOSE THE WEIGHT,
AND FIND YOUR PATH BACK TO HEALTH

According to William Davis M.D., in his book [“Wheat Belly”](#), geneticists created a new hybrid of dwarf wheat that could yield more grain per acre less than 50 years ago. The mission statement of these scientists was the promise that it would “feed the world”. They were successful in creating this frankenwheat and it increased the production of wheat in the western world. Did it feed the world?

No, it only drove down the wheat prices and made flour cheaper and readily available for more junk

food and confections. It was also successful in creating new strains of gluten protein, causing a quadrupling in celiac disease and a multitude of other gluten related illnesses. I’m not against feeding the world – it’s a great idea. I just don’t believe that abstaining from meat and

increasing grain harvests will accomplish that. It will only create more products for consumption by the richer.

World hunger is more of an economic and political issue than the lack of food. Excess production of grains only led to cheaper food prices which made it possible for people to gorge themselves into obesity. Maybe we could liposuction all the fat from overweight westerners and feed it to the poor. People are always more willing to give up their extra fat than their snack cakes and chips. Hell, I imagine even saturated human fat is healthier than grains. These foreign nations would most likely become more robust on human lipids than our lardbutt, sickly, grain-eating society and turn around and kick our ass. As far as I'm concerned, we can send every last grain grown here to the starving people of the world – I have no use for them.
